To Whom It May Concern:

Re: The SlabTite Structural System for Concrete Pool and Deck Repair

Over the past 10 years we have designed hundreds of swimming pools, retrofits, and renovations. For older pools we have found that it is not cost effective to remove and replace large areas of damaged concrete. In the past, contractors often glued metal “U” clips or pins around the crack. Often times this method was not successful and the fracture reappeared.

For many of these older structures we have found that a combination of adding reinforcement, post tensioning, anchor stitching, and epoxy injection helps restore the tensile strength across the crack. For concrete pool and deck repairs, the SlabTite process combines a variety of these methods and is considered the most effective methods to stabilize fractures.

The SlabTite Anchor Stitches are highly recommended as the best solution to restrain future movement in slabs.

Sincerely,

Shannon Kissane, President
